CSS Selectors

↳ if so you have 2 `<h1>` tags
(but you want them to look different)

A

we have specific elements in

HTML

`<h1> Our header </h1>`

`<p> The Blog Post </p>`

`<div> More Info </div>`

CSS

h1 {
color: red;
}

B

Classes
=

with classes, we can apply styles to the elements which have common/same class

`<h1 class = "blog post">`
Our header `</h1>`

`<p class = "blog post">`
The Blog post `</p>`

`<div class = "Blog post">`
More Info `</div>`

CSS

.blog - post {
color: red;
}

C

if so you want to set a certain style for all elements of entire page

→ Universal Selector

→ Styles every ele on your page

* {
color: red;
}

(Rarely used)

D

ID selectors
(set styles to one specific element)

→ exists only for one specific element in a page

`<h1 id="main-title">`
Our header `</h1>`

CSS

↳ # main-title {
color: red;
}

html

Attributes
↳

Set equal style
to all the elements
with attribute(s)

`<button disabled>`

click

`</button>`

[disabled] {

color: red;

}

kebab case
↳ lower case where names
are separated by (-) hyphen

Can also assign multiple classes to an element
in HTML with a space b/w classes

class = "section-title article-title"

Till now discussed CSS Rules

① background → Sets the BG color

② color → color of the font

③ font-family { → font style
↳ can also be imported from
google fonts
